‘There and Back Again’: New challenges and new directions in adaptation studies

*Jørgen Bruhn, Anne Gjelsvik and
Eirik Frisvold Hanssen*

Many readers will be familiar with the title of this introduction. Novel readers will know it as the subtitle of J. R. R. Tolkien's first novel, *The Hobbit, There and Back Again*, from 1937. They may even know that *There and Back Again* is the title of Bilbo's diary in Tolkien's 'sequel' *The Lord of the Rings*; a diary that Bilbo gives to his nephew Frodo to continue, and Frodo then gives to his friend Samwise at the end of the story. Film viewers will know it as the title of the second part of Peter Jackson's screen adaptation of *The Hobbit* (2012), or they may remember seeing the representation of the diary in Jackson's *Lord of the Rings: Fellowship of the Ring* from 2001.

Transferring this title to the introduction of yet another book is not an original idea then. This title and its connotations indicate a

circular movement that is crucial to understanding the adaptation process for several reasons. First, origin and authorship are less obvious categories than one might think. Second, not only telling, but also retelling a story, passing it on, can be considered valuable or even a gift. In addition, what we will describe as a meeting of media, such as the representation of Bilbo's book within the movie, is of particular interest to our discussion of the role, function and value of adaptation in contemporary media culture as well as within academic discourse. With this perspective, we place adaptation and adaptation studies within the broader framework of intermedial studies.

The adaptations of Tolkien's works are symptomatic of the position of the adaptation in contemporary culture. Tolkien adaptations were born from the movie industry's interest in adaptation of written material; novels have been a preferred source for stories on the silver screen since the birth of cinema. This is even more pronounced in the current economic climate, where the film industry, and Hollywood in particular, take advantage of recycling well-known material as a marketing strategy.

In a different arena and scale altogether, the number of fan-made tributes to the *Lord of the Rings* movies on YouTube is overwhelming. The internet provides tools and opportunities for sharing and retelling stories and events, true or fictional, faster and easier than ever before, including opportunities for users to create their own versions of written, aural, visual or cinematic material. For instance, a quote from the *Lord of the Rings* movie, spoken by the character Boromir – 'One does not simply walk into Mordor' – describing the difficulty involved in destroying the ring, has made it on to posters, into videos and even on to Google Maps. An internet site set up to follow these 'meme' transformations counts several thousand based on *Lord of the Rings* alone (See Thomas Leitch's article 'What Movies Want', Chapter 8 in this volume for more on meme¹).

On the other hand, fans of Tolkien's works have been preoccupied with cinematic adaptations before and after their premieres, following the film-maker's choices and changes with Argus eyes and discussing at length the omission of central characters, the choice of actors, or the visualization of mythical creatures.² For the dedicated audience, fidelity to the original source is still vitally important, while at the same time fans contribute to the circular

distribution of popular material and new fictions that differ considerably from the source text. The journey of this particular material – from Tolkien's typewriter to the screenwriters' solutions, to the cinematic screen, to the internet and to this introduction in an academic publication on adaptation studies – opens up the opportunity for asking many questions about what adaptations are and how they should be studied.

Our Tolkien example reflects several important themes within adaptation studies: What is an original? Should an adaptation be true to the original (the fidelity question)? What are the differences and similarities between media? What is authorship?³ The extraordinary popularity and circulation of these particular cases illuminate the importance of adaptations within contemporary culture and in academic discourse.

This anthology brings together scholars from film, literature and intermedial studies to readdress the questions of authority and originality, re-read classical texts and investigate specific cases. The book aims to take a fresh perspective on classic topics and themes within adaptation studies, posing productive questions and using new kinds of case studies. We seek to uncover the core features of adaptation as a creative process and the core activity of adaptation studies as an academic endeavour. Consequently, we also address the current relevance of such studies: Why should anyone study products that result from transferring processes between media, either novel-to-film productions or those in a larger adaptation context?

Overview of the field

This anthology contributes to what we see as the new approaches that emerged in the very lively adaptation research over the last two decades with the perspectives of scholars such as Robert Stam, John Bryant, Linda Hutcheon, Kamilla Elliott, Tom Leitch and Christine Geraghty, among others. Our approach is a combination of theoretical reflections drawing on examples and case studies with theoretical ambitions. Our professed aim is to address this central topic with fresh perspectives, new kinds of questions and new kinds of case studies.

For the past 15–20 years, adaptation research has undergone a rich development, manifested both in a large number of articles, many annual conferences, book-length studies and even journals devoted to the field.⁴ As R. Barton Palmer said, ‘Arguably, the most important development during the last two decades in cultural studies has been the increasing focus on adaptation (which can now claim to be a separate field unto itself, worthy of the prominence that specialized journals would afford it)’.⁵

In this volume, Kamilla Elliott offers a somewhat provocative perspective on contemporary adaptations research. Elliott describes an atypical academic field: research dominated by scholars who do not try to get an overview of previous work and who continuously re-invent already existing terms, analytical strategies and theoretical concepts – an emerging discipline, perhaps, but without the progression, critical self-reflection and exchange of ideas that ought to characterize academic research. To decide for themselves if Elliott’s portrayal is fair, readers should consider the polemical, thoroughly researched article as a guide to the wide field of adaptation research.

From a less evaluative point of view, we wish to point to a number of characteristic theoretical and analytical clusters that we find to be typical for the field. Among important aspects found in the rich harvest of material are the questions of how to use adaptation creatively in teaching, and what place adaptation studies should occupy in curricula and pedagogic practices. In addition, the relationship between screenwriting and adaptation has been discussed, and adaptation also has been studied within the broader framework of transcultural transformations and translation, as well as new media formats and technology.⁶

Five characteristic theoretical and analytical clusters are predominant in current adaptation research, and these can be seen in this volume. First is the question of fidelity, which adaptation studies universally addresses. Second is the attempt to open up the field to a broader variety of media relations beyond the usual novel-to-film relationship. A third important trend is the way that some contributors consider adaptation as a multilevel rather than a one-to-one relationship (for example, one poem interpreted into one painting). Fourth, the book probes the idea that adaptation may not be a one-way transport from source to result, but a two-way, dialogic process. Finally, some chapters examine the way that global

theoretical frameworks (intermediality or genetic criticism, for example) can be used in adaptation studies.

The unavoidable question of fidelity

A central – perhaps even *the* central – question of adaptation studies has been that of fidelity, or the relationship between what has been considered an original and the more-or-less faithful rendering of that form or content into a new product. From the very outset of adaptation criticism (see Elliott's historical schematization), scholars have criticized the idea that faithfulness is the most interesting and productive instrument with which to confront adaptations; early on, critics argued that fidelity is both difficult to ascertain and problematic for normative evaluation. Accordingly, adaptation studies based on fidelity have traditionally been debunked, and most current research considers fidelity discourse as no longer viable.

Although fidelity discourse has been abandoned, the issue of similarities and differences is still very much present in contemporary research. Adaptation must necessarily incorporate some kind of comparative element – seeing one text in relation to another – and the strategic and almost universal move in the field has been to 'translate' fidelity into the more neutral, and thus useful, measure of similarity and difference on various levels of the compared texts. In part one, 'Rethinking the Core Questions', Lars Elleström offers a new approach to the question of fidelity by creating a nomenclature of adaptation, based on his larger systematization of intermediality studies and media theory.

Another way of avoiding the inherent normativity so often found in fidelity discourses (which implies, in one archetypical adaptation tradition, that literature is richer, deeper or more complex than film) is to focus once again on the medium specificity, thus rethinking, perhaps in new terms, the distinctions developed at least as early as Lessing's *Laocoon* in the eighteenth century. In the case study section, film scholar Anne Gjelsvik reactivates the medium specificity debate by rephrasing Seymour Chatman's classical study; 'What Novels Can Tell That Movies Can't Show' (Chatman 1980). Medium specificity

is confronted with troublesome representations of violence in Michael Winterbottom's adaptation of Jim Thompson's *The Killer Inside Me*, and Gjelsvik is forced to rethink the objectivity of medium specificity definitions with more ethical considerations. Fidelity, then, is questioned but not forgotten in current research, where it constantly resurfaces in the form of questions of medium specificity based on non-evaluative grounds.

Widening the possible sources

Traditionally, adaptation studies focuses on novels transferred to films, 'text to cinema' or 'literature on screen', as reflected in the central book titles, such as Brian MacFarlane's *Novel To Film: An Introduction to the Theory of Adaptation* (1996), Deborah Cartmell and Imelda Whelehan's 1999 anthology, *Adaptation: From Text to Screen, Screen to Text* and Christine Geraghty's *Now a Major Motion Picture: Film Adaptations of Literature and Drama* (2008). This academic interest results in part from the film industry's preference for adapting classical literature or bestsellers, ranging from Tolkien's *Lord of the Rings*, classic novels by Charles Dickens or Jane Austen, to modern bestsellers such as the *Millennium*, *Twilight* and the *Harry Potter* series.

In part, this interest reflects a struggle for dominance between the different media (literature and film) and several academic disciplines' attempt to 'dominate' the object. Consciously or not, adaptation is often a paragone debate.⁷ Thomas Leitch reformulated this conflict in the following way:

Because "literature," unlike "cinema," is already an honorific, however, any discussion of literature on screen, as opposed to journalism or comic books or video games on screen, will begin willy-nilly with a bias in favour of literature as both a privileged field (literary texts are what movies normally adapt) and an aesthetically sanctified field (literary texts have already been approved by a jury whose verdict on their film adaptations is still out).⁸

Film adaptations of sources deemed unworthy of academic

(literary) interest is not a new phenomenon, and pulp fiction has been the source for innumerable, highly respectable adaptations, for instance by Alfred Hitchcock.⁹ However, a shift in values in adaptation studies has occurred as cultural studies has redefined which content is worthy of analysis as material for adaptation. Accordingly, contemporary critical writing has taken a wider perspective on possible sources, moving from the conventional classical or heritage material to study adaptations of computer games or biographies, following the trends of contemporary cultural production.¹⁰ For instance in *A Theory of Adaptation*, Linda Hutcheon investigates adaptation across all media, focusing on the creative and receptive process. Hutcheon includes video games and theme parks among her examples, concluding with the question, 'What is not an adaptation?' In her continuum model, the parodies of *Lord of the Rings* are regarded as adaptations. Of course, this discussion is not new: Eirik Frisvold Hanssen's essay on André Bazin (Chapter 7) examines how the French film theorist placed film adaptations within a broad cultural historical context entailing different media, different processes of adaptation and mass reproduction. Likewise, Bazin's analyses on adaptation and questions of fidelity equate literary adaptation to filmic representations of painting and theatre.

While acknowledging the multitude of the adaptation banner, many scholars coming from literature studies nevertheless continue to explore the novel-to-screen adaptation, such as Cartmell and Whelehan's notable contribution, *Screen Adaptation: Impure Cinema*. However, *Adaptation Studies: New Challenges, New Directions* includes both contributors who discuss movies based on novels and those who aim to broaden the field. For example, in her article on *Invictus*, Sara Brinch analyses the translation of biographical and photographic material into a feature film; new approaches are needed when narratives that lack the suspense and plot of literature are compared with the cinematic end product. Jonas Ingvarsson, investigating the famous Orson Welles' radio adaptation of H. G. Wells' novel *The War of the Worlds*, offers another constellation of the adaptation theory: novel to radio drama.

Networks of influence

Another detectable trend in adaptation studies is the movement away from a one-to-one relationship, that is, between *one* source (such as a novel) and *one* film. Instead, adaption is viewed within a more comprehensive understanding of the cultural and textual networks into which any textual phenomena is understood. Christine Geraghty's work is an important example of this methodology. Both in *Now a Major Motion Picture* (2008) and in her reading of Joe Wright's 2007 film *Atonement*, based on Ian McEwan's novel of the same name, she demonstrated that an adaptation necessarily relies on and cites a widespread web of influences. For example, Geraghty described how Wright represented World War II with a number of references that supported the main representation while 'quoting' non-literary visual texts.¹¹

The attempt to investigate the field 'between' source and adaptation is also important for several contributors to this volume. Regina Schober proposes Bruno Latour's so-called actor-network model as a way to widen the narrow understanding of the trans-medial aspect of adaptation studies. Jonas Ingvarsson, discussing Welles'/Wells' *War of the Worlds*, introduces Friedrich Kittler's media archaeological perspective to find new approaches to his material that are not limited to the novel as a source-text. Using material from the Ingmar Bergman archives, Anna Sofia Rossholm opens up new ways to discuss the creative process of artistic work; the artist's diaries are placed as a kind of highly influential and active midway station between a source (perhaps an idea or an earlier work of art) and the final result. Thomas Leitch offered a widened perspective in his influential *Film Adaptation and its Discontents* (2009); in this volume, he uses Pasolini's contemplations on the screenplay as a structure that wants to become another structure, to discuss 'the gradual changes in textual generations wrought by evolutionary processes', which is yet another way to focus on the rich field in-between a source and the adaptation. Finally, Hajnal Király broadens the narrow source-to-result understanding when she shows how aspects of nineteenth-century visual culture have a double influence, both on novelists (Flaubert and Proust) and on directors who have adapted these 'visual' novels to the screen.

Two-way understandings of adaptation

The conventional and common sense understanding of adaptation is one-directional; *adaptation* is defined as the transport of form and/or content *from* a source *to* a result, such as from novel to film or any other adaptive constellation. From a certain viewpoint, this understanding of adaptation is correct; without a source text, a result could not be imagined. However, Jørgen Bruhn poses the question: Should we not admit that the adaptive process is dialectical, and that the source text is changed in the process of adaptation as well? The idea is not new, and Elliott points out that several scholars have hinted at such a process, including Bazin, Cohen, Whelehan and Cardwell. But perhaps the strongest impetus for thinking about the source-result relationship as a dialectical one is Robert Stam's work. Stam drew his ideas not from film studies, but instead applied the ideas of Bakhtin and Kristeva on intertextuality to novel-to-film adaptations. Anna Sofia Rossholm's archival research, combined with the methodology of genetic criticism in her study, participates in this dialectical process as she moves back and forth between unpublished notebooks, printed material, verbal commentaries and the canonical films. As such, Rossholm's argument deals with the important question of the adaptive relation between screenwriting and films that, after long neglect, has surfaced in recent years as a core question in film studies, including adaptation theory. Leitch, too, moves into this underdeveloped field when he engages in a wide-ranging and almost dizzying argument involving Pasolini's arguments of the will of the screenplay, cultural memes and adaptation theory.

From a methodological perspective, Kamilla Elliott's main argument in her critical article is that adaptation studies ought to move forward with a 'dialogic' process, avoiding the atomistic details of the 'twenty-page case study article' and the abstract theoretical attempts where the specific examples are mere examples. According to Elliott, new results and creative methods in the field will come from theory developed in connection with adaptation analysis and analytical method created through theoretical reflection.

Adaptation as part of comprehensive theories on cultural processes

Recently, adaptations as a cultural phenomenon or practice have also attracted the interest of scholars who do not primarily study adaptation as such, but rather attempt to establish more comprehensive and general theories regarding cultural transfer, textuality, media specificity and intermediality.

During the 2000s, works on adaptation by scholars such as Linda Hutcheon and Thomas Leitch were influential because of the broad perspectives that they offered. Hutcheon's book *A Theory of Adaptation* (2006) proposed a general theory of adaptation as a kind of formal product, and more importantly, a creative and interpretative *process* taking place within a variety of media and cultural phenomena. This process should be examined through an established set of general and basic terms, questions and concepts that can be applied to diverse phenomena or 'media'. Hutcheon did not limit her perspective to different forms of transfer between texts, but emphasized the importance of situating adaptations within a broader framework, relating to political, economic and legal circumstances, and defining the participants contributing to the adaptations: the 'adapters', the audience and the cultural context. Although focusing on film adaptations, Leitch also broadened the variety of sources that have been made into films, posing questions that addressed more general cultural circumstances and changes.

Scholars who have examined adaptation from such a general point of view do not necessarily belong to the field of adaptation studies or film studies. For example, literary scholar Julie Sanders linked the practices of adaptation and appropriation together in what she described as 'a sub-section of the over-arching practice of intertextuality.'¹² In Chapter 3, John Bryant, coming from the field of textual editing and genetic criticism, applies his concept of the fluid text on the question of adaptation. Hutcheon, among others, has drawn on Bryant's term in her own work, arguing that a text is no fixed thing.¹³ Understanding a 'work' as the sum of its versions, Bryant suggests how an adaptation can be understood as a 'version' of an originating text, taking part in the creative process that traditionally is associated primarily with the different

stages taking place before a so-called 'finished work' is published. Anna Sofia Rossholm's essay is inspired by genetic criticism and notions of the fluid text as she views Ingmar Bergman's films as 'adaptations' of his pre-production notebooks. Her approach echoes Leitch's appropriation of Pasolini's claim that a screenplay is a structure that wants to be another structure (Chapter 8). Likewise, Lars Elleström, from the field of intermedia studies, examines and challenges certain definitions and practices which he locates in a number of recent theoretical works on adaptation, with regard to a more general understanding of media transformation and the modalities. In Chapter 6, Elleström explores how the term 'adaptation' relates to his own concept of 'transmediation,' how these terms overlap, and what phenomena they include and exclude. Hanssen's essay describes how Bazin in the 1940s and 1950s turned to certain cultural and aesthetic aspects of contemporary film adaptations to devise theories for the ontology of cinema as a medium.

In these examples, adaptations are understood in terms of how they function as case studies or examples that illuminate much broader questions. In Bryant's case, adaptation explores what we understand as a 'text', a 'work' and a 'version'. In Elleström's case, adaptation is used to rigorously define the concept of 'medium' and the systemic relationships between media. Finally, in Bazin's case, adaptation becomes a way to explore and understand the specificity and ontology of cinema.

If space allowed, this introduction could conduct a case study based on the five areas of interest sketched above. Such a comprehensive case study could investigate the complicated transformation of the fictional musings of an Oxford linguist and medievalist now better known as a fantasy-writer. It could describe the textual travels from Tolkien's studies of the Finnish *Kalevala* and his treatises on the history of the English language, as well as of *Beowulf*, which move into his fantasy works, among them *The Hobbit*. These texts were adapted into cinematic versions, which, following the nature of 'texts that want to be other texts' (see Leitch's contribution), continue to generate interminable discussions and parodies on the World Wide Web. But this must be the task of other writers.

The Tolkien phenomenon functions as one specific, highly exemplary part of adaptation studies that illuminates general questions about our current media-saturated culture, and pinpoints

the way images, texts, film clips and musical fragments incessantly cross media borders. Adaptation studies, if such a thing can be meaningfully defined as a field or a discipline at all, is a productive framework for analysing central and complex contemporary cultural phenomena typical of our own period.

Overview of the book

Adaptation Studies: New Challenges, New Directions establishes a dialogue between scholars coming from adaptation studies and intermediality studies, as well as film and literature scholars. The contributors were asked to reconsider the basic questions underlying adaptation studies in general, and novel-to-film studies specifically, and to focus either on a theoretical or methodological point of view or a case study.

The volume, accordingly, is organized into two parts: chapters 2–8 offer new approaches to adaptation studies (especially influenced by intermediality studies) and re-readings of theories of adaptation, and chapters 9–13 that offer case studies to open up new fields within adaptation studies (such as notebooks, screenplays, true stories and violence).

Rethinking the core questions

In the opening essay, Kamilla Elliott addresses what she considers the excessive theoretization of adaptation studies. Her essay calls for a deconstruction of the current one-way, hierarchical relationship between theories and adaptations (theorizing adaptations) and recommends a reciprocal relationship that requires theories to adapt to adaptations (adapting theories). By way of an extensive historical survey of the field, she discusses the divide between formal and cultural approaches to adaptations, the repetitions of claims and the remarkable failure to accumulate knowledge in the field. Elliott advocates a more robust engagement with prior research as well as the need for theories to adapt to adaptations, arguing that ‘applying concepts that adaptations themselves give rise to can help us to theorize our field.’ Finally, in

line with the ambitions of this volume, she advocates for the importance of intermedial engagement among scholars from different disciplines.

John Bryant regards adaptation studies from the viewpoint of text genetic criticism and his own influential concept of 'the fluid text'. He suggests, 'If adaptation is to achieve its proper textual legitimacy, we need a broader conception of work, creative process, and writing.' Bryant rethinks these three categories by discussing *Moby Dick* as both a textual object that enters Edward Said's political discussions and a text that is turned into a new filmic text. Critics and editors – and consequently, also adaptation studies – Bryant argues, should study the 'critical distances' between adapted texts, keeping intact the memories of the texts that are being adapted.

Jørgen Bruhn suggests a redirection of adaption studies, from the one-way conveyance from novel to film to a two-way dialogic process. Adaptation, Bruhn proposes, results in both a new filmic version and a change in the original text. Taking Jan Troell's cinematic adaptation of Swedish writer Vilhelm Moberg's *The Emigrants* as an example, Bruhn stages a dialectical relationship between novel and film, where both texts becomes precedents for each other.

Regina Schober presents and discusses Bruno Latour's actor-network model in adaptation studies. Schober combines classical philosophy (Hume) and contemporary neural research to discuss the question 'what is a connection?' She then proposes new ways to understand the fundamental concept of 'transmediality', as found in intermediality studies, which have direct implications for the study of adaptations.

Lars Elleström, from the viewpoint of intermediality studies, argues that a consistent theory of medium is necessary to understand media transformations. Through a sophisticated theoretical discussion of media, he offers a new framework for studying media transformations, based on the notion that all art forms and media are interrelated, and accordingly, should be compared. At the same time, he provides more precise definitions of what is being transferred in adaptation processes.

Eirik Frisvold Hanssen examines the recent renewed and increasing interest in André Bazin's writings within adaptation studies, and film studies in general. Hanssen views Bazin's writings

on adaptation and intermediality within the context of his general theory on the ontology of cinema, and argues for returning to classical film theory when attempting to consider the complex relationships between cinema and other media.

In 'What Movies Want', Tom Leitch begins with the idea that almost all texts want to be other texts. Discussing the difficult idea that texts, or movies, may 'want' anything, Leitch moves to ideas of biological evolution to reach the concept of memes, defined as 'micro-units of cultural knowledge' travelling in screenplays or movies, for instance. These meme-vehicles are 'machines like the human brain, designed for whatever purpose that also happens to have the subsidiary effect of insuring the survival and propagation of the fittest memes.' In a final, startling move, Leitch sketches a new and productive definition of agency, connecting to Latour, Serres and Yates, which may impact the way we understand the phenomenon of adaptation.

Rethinking the case study

In chapter 9, Hajnal Király addresses how novels that are particularly visual are, ironically, often considered impossible to adapt into films. Arguing the usefulness of Bolter and Grusin's concept of remediation in novel-to-film adaptation studies, Király investigates the representation of, and intersection between, female characters and visual media addressed in recent adaptations of nineteenth-century novels by Flaubert and Proust.

Based on archival research, and drawing on genetic criticism methodologies, Anna Sofia Rossholm considers Ingmar Bergman's notebooks as the preparations for *Persona*, both as a source, an original and a pre-text. Rossholm considers the transition from notebook to film as an adaptation, exploring the notebook as an aesthetic form belonging to the genre of the diary, and thus the finished film as a form of diary adaptation.

In her article, 'Tracing the original', Sara Brinch investigates Clint Eastwood's film, *Invictus* (2009), based on several 'originals': a true story, a nonfiction book, photographs and a poem. What is the original source of a historical fiction film? Brinch asks, and by so doing, questions both the foregrounding of text and narrative

in adaptation studies and the notion that a narrative built on a so-called true story should be considered an adaptation.

Coming from film studies, Anne Gjelsvik reframes the classical question, 'What Novels Can Tell That Movies Can't Show', by investigating an issue somewhat neglected by adaptation studies – violent representations. Historically, violent representations have been considered more challenging and provocative in cinema than in literature. Through a close reading of a violent scene in Jim Thompson's novel *The Killer Inside Me*, and Michael Winterbottom's film adaptation, Gjelsvik aims to grasp some of the differences between the two media.

Approaching the question of adaptation studies from the viewpoint of Marshall McLuhan's media theory and Friedrich Kittler's media historical framework, Jonas Ingvarsson offers a reading of Orson Welles' famous radio adaptation of H. G. Wells' novel *The War of the Worlds*. Using perspectives from media archeology, Ingvarsson reformulates the basic questions of adaptation theory while also suggesting a new reading of both novel and radio play.
